

Setting `dynamic` to `false`

- New fields are ignored
 - They are not indexed, but still part of `_source`
- No inverted index is created for the `last_name` field
 - Querying the field gives no results
- Fields cannot be indexed without a mapping
 - When enabled, dynamic mapping creates one before indexing values
- New fields must be mapped explicitly

There's a better way...

- ... setting `dynamic` to `"strict"`
- Elasticsearch will reject unmapped fields
 - All fields must be mapped explicitly
 - Similar to the behavior of relational databases
