

# How keyword fields are analyzed

- keyword fields are analyzed with the keyword analyzer
- The keyword analyzer is a no-op analyzer
  - It outputs the unmodified string as a single token

# Lecture summary

- `keyword` fields are analyzed with the `keyword` analyzer
- The `keyword` analyzer is a no-op analyzer
  - It outputs the unmodified string as a single token
  - This token is then placed into the inverted index
- `keyword` fields are used for exact matching, aggregations, and sorting
